

containers → "images"

[Containers are ephemeral, not persistent]  
[No data should be saved on the container level]

[docker pull ubuntu:tag]

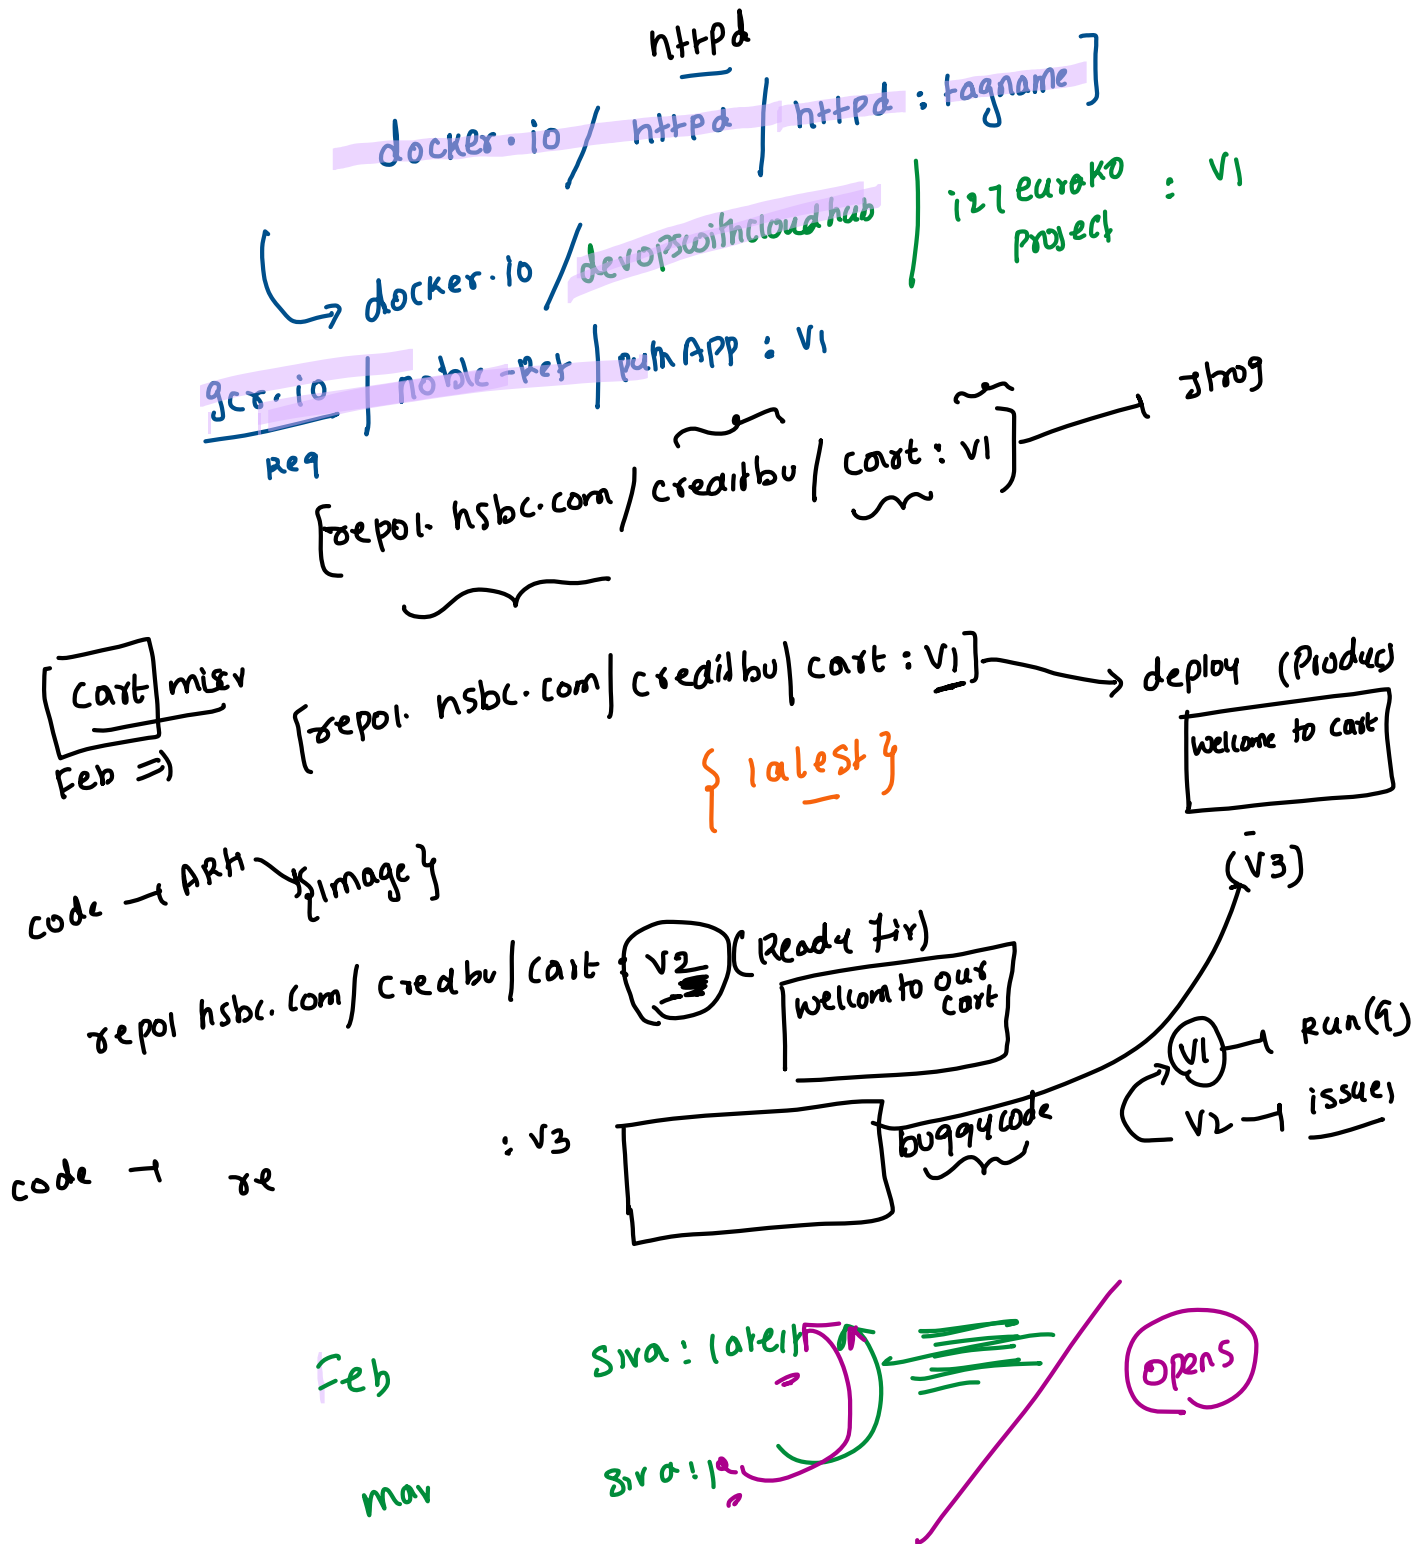

ubuntu → conf  
(deploy the APP)  
"Package"

(Dockerfile)

devopswithcloudhub/i27eurekaproject:tagname

Siva laptop

docker.io/acin/repo tag  
gcr.io/pid/repo.tag

[Registry]  
Place where  
container image are  
stored.

Phani laptop

- 1) Docker registry
- (2) Google Container Registry
- 3) Amazon "
- 4) Azure "
- 5) Github Registry

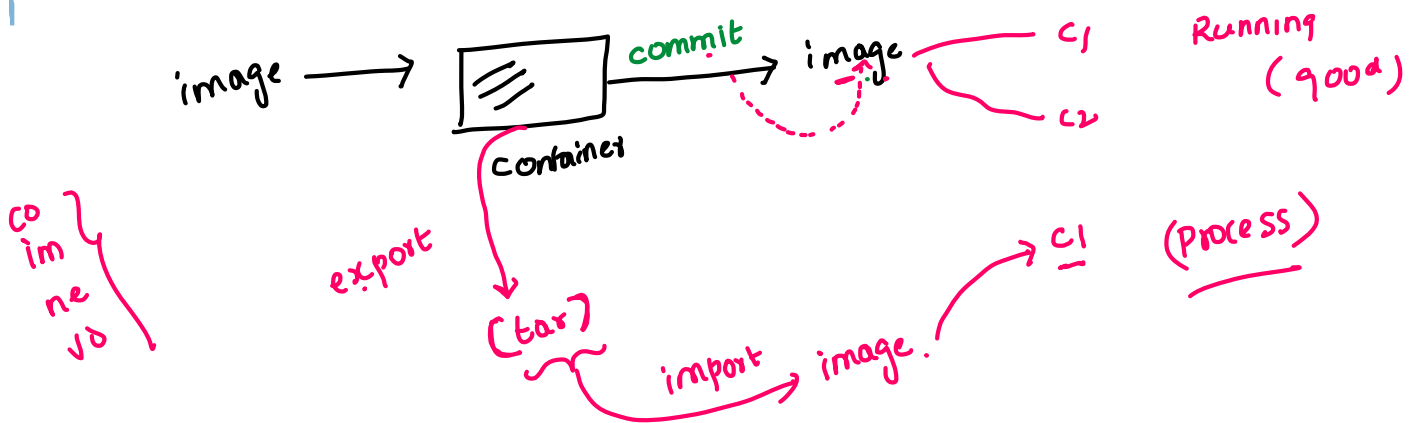

B1 → SRC6

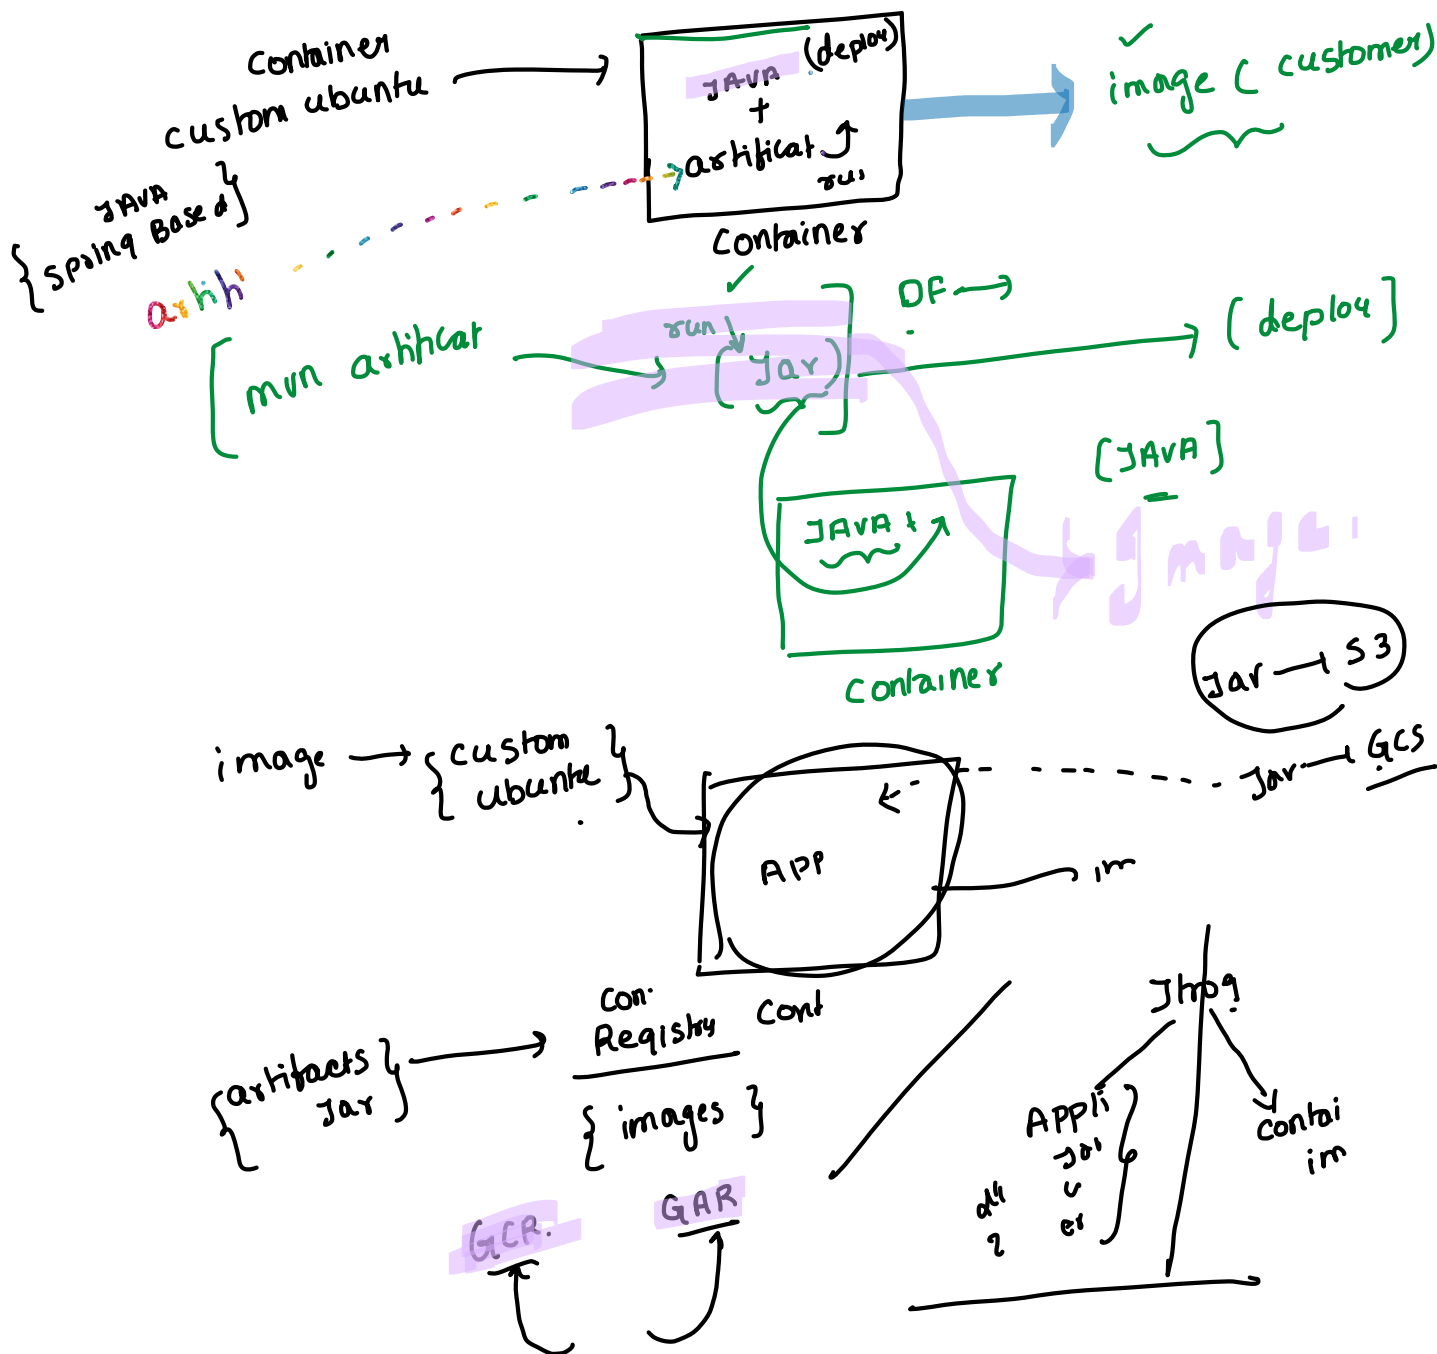

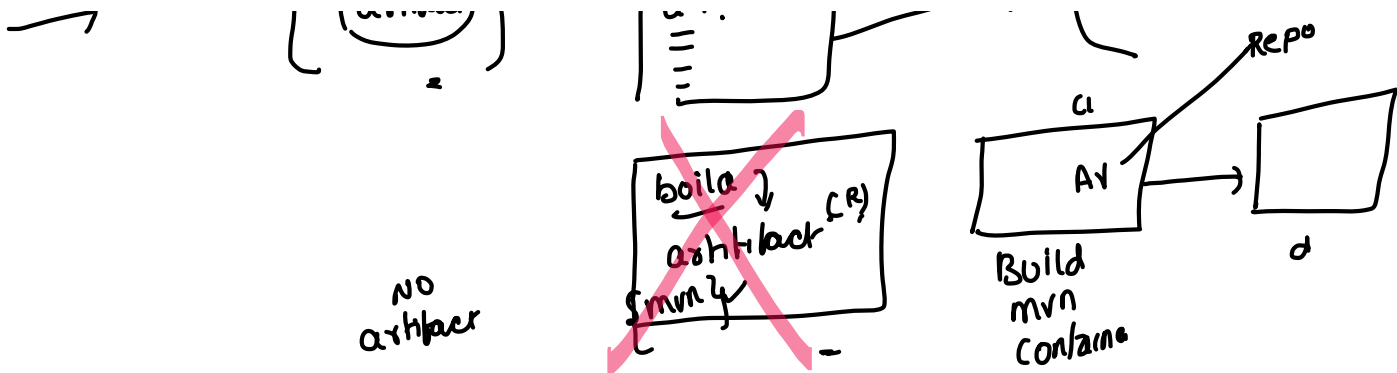

Very rarer

Mandatory  
int

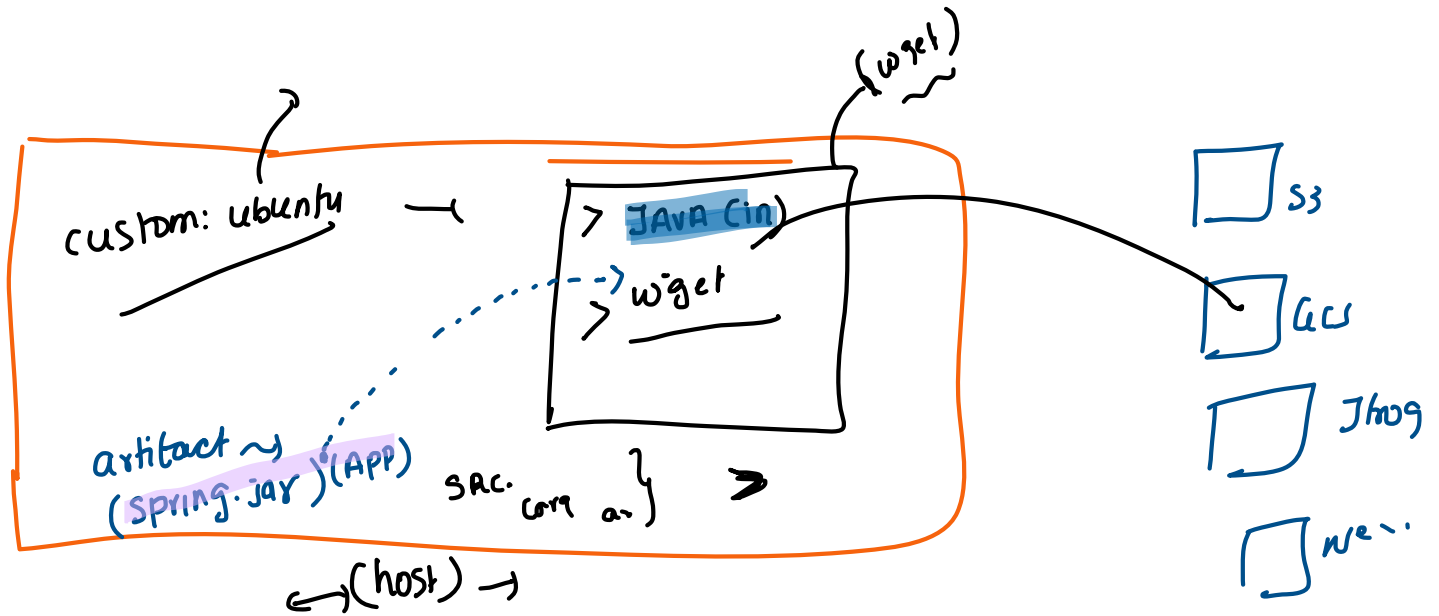

{ images } with Az  
vim GLE  
A-m1 → EC2  
cosmoima → cont im

- 1- docker commit → create a image from container.
- 2 docker export → creating a tarfile from container.
3. docker import → creating a image from tarfile
- 4 docker save → creating a tarfile from image
- 5) docker load → loading a image from tarfile

{ Port }

intra (351000 \$)

[App down]  
(aux)

(5 sec)  
h/a → m

(--restart)
